

# RNA-Seq Data Analysis 27-28 November, 2017

Taught module for DPhil programme in  
Genomic Medicine and Statistics

Organised and delivered by Bioinformatics Core at WHG:

Helen Lockstone M.Sc.

Ben Wright PhD

Santiago Revale, M.Sc.

# Sequencing overview and RNA-Seq applications

**Santiago Revale, M.Sc.**

Senior Bioinformatics Analyst, Bioinformatics Core Group

# Transcriptome

Set and quantity of RNAs in a cell, tissue or organism, for a specific developmental stage or physiological condition.

**Is dynamic!**  
**It varies in time and space.**

It's a technology that uses the NGS capabilities to reveal a snapshot of the presence and quantity of RNA in a sample at a given moment in time.

# RNAseq: it's always about the goals!

At RNA transcript level, it provides the ability to:

- ✓ look at alternative gene spliced transcripts,
- ✓ post-transcriptional modifications,
- ✓ gene fusion,
- ✓ mutations/SNPs,
- ✓ changes in gene expression.

Can look at different populations of RNA to include:

- ✓ total RNA,
- ✓ mRNA,
- ✓ small RNA (miRNA, tRNA, ribosomal profiling, etc.)

Can be used to:

- ✓ determine exon/intron boundaries,
- ✓ verify or amend previously annotated 5' and 3' gene boundaries.

# Common main goals

- Catalog all species of transcripts, e.g. messengers, non-coding, small, etc.
- Determine the transcriptional structure of genes, in terms of their starting sites, 5' and 3' ends, splicing patterns and other post-transcriptional modifications.
- Quantify the changes in the expression levels of each transcript during development and/or in different conditions.

- **Enriched for polyadenylated transcripts (polyA)**  
PolyA enrichment is good for mature protein coding transcripts – requires good quality total RNA.
- **Depleted for ribosomal RNA transcripts (ribodepleted)**  
Ribodepletion is good for including all non-polyadenylated RNA – also good for degraded material.
- **Amplified from low input material (SMARTer)**  
SMARTer is good for low input samples, down to a single cell – requires good quality total RNA or fresh cell lysate.
- **Small RNA species**  
Small RNA require a separate preparation but can be run in parallel to polyA.
- **3' mRNA**  
3'mRNA is good to minimise costs/maximise sequencing lane capacity – some tolerance to degraded material.

# Genomics Platforms

# Sequencing Outputs

## Illumina HiSeq 4000

|                        |                 |      |
|------------------------|-----------------|------|
| Output range           | 105 – 1500 Gb   |      |
| Reads per run          | 2.1 – 5 billion |      |
| Max. read length       | 2 x 150 bp      |      |
| Run time               | < 1 – 3.5 days  |      |
| Samples sequenced per: | Flowcell        | Lane |
| polyA                  | 80              | 10   |
| Ribodepleted           | 40              | 5    |
| 3' mRNA                | 384             | 48   |
| CHIPseq                | 80              | 10   |

## Illumina HiSeq 2500

|                        |                 |      |
|------------------------|-----------------|------|
| Output range           | 9 – 1000 Gb     |      |
| Reads per run          | 0.3 – 4 billion |      |
| Max. read length       | 2 x 250 bp      |      |
| Run time               | < 1 – 6 days    |      |
| Samples sequenced per: | Run             | Lane |
| Small RNA              | 168             | 21   |

# Typical RNAseq experiment

# Experimental Design

# How is an experiment designed?

**While a good design does not guarantee a successful experiment, a suitably bad design guarantees failure.**

# Tissue specificity

## SKIN

|         |                             |                       |
|---------|-----------------------------|-----------------------|
| 0031424 | keratinization              | $2.9 \times 10^{-14}$ |
| 0006955 | immune response             | $3.5 \times 10^{-13}$ |
| 0031069 | hair follicle morphogenesis | $4.1 \times 10^{-7}$  |

## LUNG

|         |                             |                       |
|---------|-----------------------------|-----------------------|
| 0030324 | lung development            | $6.2 \times 10^{-16}$ |
| 0006954 | inflammatory response       | $2.1 \times 10^{-15}$ |
| 0043330 | response to exogenous dsRNA | $6.2 \times 10^{-6}$  |

## ADRENAL

|         |                                  |                      |
|---------|----------------------------------|----------------------|
| 0006700 | C21-steroid hormone biosynthesis | $4.6 \times 10^{-8}$ |
| 0017157 | regulation of exocytosis         | $4.2 \times 10^{-4}$ |
| 0006584 | catecholamine metabolism         | $1.4 \times 10^{-3}$ |

## KIDNEY

|         |                                  |                      |
|---------|----------------------------------|----------------------|
| 0001822 | kidney development               | $1.4 \times 10^{-6}$ |
| 0007588 | excretion                        | $1.3 \times 10^{-3}$ |
| 0001736 | establishment of planar polarity | $2.9 \times 10^{-3}$ |

## MUSCLE

|         |                             |                       |
|---------|-----------------------------|-----------------------|
| 0006941 | striated muscle contraction | $7.7 \times 10^{-11}$ |
| 0005977 | glycogen metabolism         | $1.8 \times 10^{-9}$  |
| 0045445 | myoblast differentiation    | $8.0 \times 10^{-7}$  |

## TESTIS

|         |                        |                       |
|---------|------------------------|-----------------------|
| 0007059 | chromosome segregation | $9.1 \times 10^{-15}$ |
| 0007276 | gametogenesis          | $8.1 \times 10^{-4}$  |
| 0006349 | imprinting             | $1.5 \times 10^{-3}$  |

## BRAIN

|         |                        |                       |
|---------|------------------------|-----------------------|
| 0007268 | synaptic transmission  | $8.9 \times 10^{-41}$ |
| 0016358 | dendrite morphogenesis | $1.2 \times 10^{-10}$ |
| 0007611 | learning or memory     | $7.9 \times 10^{-6}$  |

## THYMUS

|         |                                  |                       |
|---------|----------------------------------|-----------------------|
| 0019882 | antigen presentation             | $7.1 \times 10^{-21}$ |
| 0045059 | positive thymic T cell selection | $9.8 \times 10^{-8}$  |
| 0045060 | negative thymic T cell selection | $2.6 \times 10^{-7}$  |

## HEART

|         |                                      |                       |
|---------|--------------------------------------|-----------------------|
| 0006099 | tricarboxylic acid cycle             | $2.5 \times 10^{-15}$ |
| 0045214 | sarcomere organization               | $7.5 \times 10^{-12}$ |
| 0008016 | regulation of heart contraction rate | $8.3 \times 10^{-7}$  |

## LIVER

|         |                        |                      |
|---------|------------------------|----------------------|
| 0008203 | cholesterol metabolism | $2.6 \times 10^{-8}$ |
| 0007596 | blood coagulation      | $2.0 \times 10^{-7}$ |
| 0000050 | urea cycle             | $5.0 \times 10^{-5}$ |

## SPLEEN

|         |                                     |                      |
|---------|-------------------------------------|----------------------|
| 0050766 | positive regulation of phagocytosis | $4.5 \times 10^{-9}$ |
| 0030183 | B cell differentiation              | $1.5 \times 10^{-7}$ |
| 0030217 | T cell differentiation              | $2.6 \times 10^{-7}$ |

## INTESTINE

|         |                       |                       |
|---------|-----------------------|-----------------------|
| 0006955 | immune response       | $7.0 \times 10^{-13}$ |
| 0007586 | digestion             | $9.3 \times 10^{-5}$  |
| 0050892 | intestinal absorption | $4.6 \times 10^{-4}$  |

## OVARY

|         |                        |                       |
|---------|------------------------|-----------------------|
| 0007059 | chromosome segregation | $1.0 \times 10^{-12}$ |
| 0007276 | gametogenesis          | $8.6 \times 10^{-8}$  |
| 0006349 | imprinting             | $3.5 \times 10^{-5}$  |

# Time dependent

# Replicates (technical / biological)

# Coverage

- Even for annotation

- Target transcript properties (low abundant vs high abundant transcripts)

- Uneven for DGE

- Allele might not be detected (not in the genome/not being expressed)
- Estimate expression of each allele

# Subjectivity of the analysis

- ✓ Multitude of algorithms and pipelines available.
- ✓ Most approaches correct, but have to be tailored to the needs of the investigators in order to better capture the desired effect.

# Data management & Downstream interpretation of the data

- ✓ Several Gigabytes (70-75 Gb Avg)
- ✓ Different layers of interpretations have to be considered (e.g. biological, clinical, regulatory functions, etc.)

# Recommendations based upon experimental objectives.

| Criteria                       | Annotation                                                                              | Differential Gene Expression                                                                    |
|--------------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Biological replicates          | Not necessary but can be useful                                                         | Essential                                                                                       |
| Coverage across the transcript | Important for de Novo transcript assembly and identifying transcriptional isoforms      | Not as important; however the only reads that can be used are those that are uniquely mappable. |
| Depth of sequencing            | High enough to maximize coverage of rare transcripts and transcriptional isoforms       | High enough to infer accurate statistics                                                        |
| Role of sequencing depth       | Obtain reads that overlap along the length of the transcript                            | Get enough counts of each transcript such that statistical inferences can be made               |
| DSN                            | Useful for removing abundant transcripts so that more reads come from rarer transcripts | Not recommended since it can skew counts                                                        |
| Stranded library prep          | Important for de Novo transcript assembly and identifying true anti-sense transcripts   | Not generally required especially if there is a reference genome                                |
| Long reads (>80 bp)            | Important for de Novo transcript assembly and identifying transcriptional isoforms      | Not generally required especially if there is a reference genome                                |
| Paired-end reads               | Important for de Novo transcript assembly and identifying transcriptional isoforms      | Not important                                                                                   |

# Typical RNAseq experiment

# Typical RNAseq experiment

## RNA Preparation

Isolate and purify input RNA.

## Sequence

Sequence cDNAs using a sequencing platform.

## Prepare Libraries

Convert the RNA to cDNA; add sequencing adapters.

## Analysis

Analyze the resulting short-read sequences.

# Data Analysis

# Stereotypical RNA-seq analysis pipeline

1. Demultiplex, filter, and trim sequencing reads.
2. Normalize sequencing reads (if performing *de novo* assembly)
3. *de novo* assembly of transcripts (if ref genome is not available)
4. Map sequencing reads to reference genome or transcriptome
5. Annotate transcripts assembled or to which reads have been mapped
6. “Count” mapped reads to estimate transcript abundance
7. Perform statistical analysis to identify differential expression (or differential splicing) among samples or treatments
8. Perform multivariate statistical analysis/visualization to assess transcriptome-wide differences among samples

# 1. Read processing

Table 5.1 Read Processing Software

**For *de novo* assembly**

| Software      | De-multiplexing | Adaptor Trimming | Quality Filtering/ Trimming | K-mer Filtering | K-mer Normalization |
|---------------|-----------------|------------------|-----------------------------|-----------------|---------------------|
| FASTX-Toolkit | ✓               | ✓                | ✓                           |                 |                     |
| Goby          | ✓               | ✓                |                             |                 |                     |
| khmer         |                 |                  |                             | ✓               | ✓                   |
| NGS_backbone  |                 | ✓                | ✓                           |                 |                     |
| Stacks        | ✓               | ✓                | ✓                           | ✓               | ✓                   |
| trimmomatic   |                 | ✓                | ✓                           |                 |                     |
| biopieces     | ✓               | ✓                | ✓                           |                 |                     |

# *de novo* assembly or reference mapping?

## When to use each?

### ***de novo***

(do **not** know the  
transcriptome)

(main goal is to **discover**  
NOT to quantify)

### **reference**

(do know the  
transcriptome)

(main goal is to **quantify**  
NOT to discover)

## Protocol for *de novo* RNAseq

## Protocol for reference-based RNAseq

# 3. *de novo* transcriptome assembly

# 4. Map RNA data against genome

e.g. TopHat

e.g. GSNAP

## c Potential limitations of exon-first approaches

# 6. Expression quantification

## Normalization

a

Influence of length: Counts are proportional to the transcript length times the mRNA expression level.

Influence of sequencing depth: The higher sequencing depth, the higher counts.

"Gene counts" should be corrected in order to minimize these biases: **normalization**.

**Statistical model** should take into account "length" and "sequencing depth".

## Some normalization methods

- **RPKM** (Mortazavi *et al.*, 2008): Counts are divided by the transcript length (kb) times the total number of millions of mapped reads.
- **Upper-quartile** (Bullard *et al.*, 2010): Counts are divided by upper-quartile of counts for transcripts with at least one read times the square root of transcript length.
- **Quantiles**, as in microarray normalization (Irizarry *et al.*, 2003).
- **FPKM** (Trapnell *et al.*, 2010): Instead of counts, Cufflinks software generates FPKM values (Fragments Per Kilobase of exon per Million fragments mapped) to estimate gene expression, which are analogous to RPKM.

# 6. Expression quantification

## Isoforms

e.g. Cufflinks, RSEM

# 6. Expression quantification

## Gene expression

# 7. Differential expression analysis

# 8. Data visualization

# 8. Data visualization

Hierarchical clustering of transcripts and samples.

Spearman correlation matrix

Transcript clusters extracted from the hierarchical clustering.

# 8. Data visualization

## Strand-Specific RNA-Seq Reveals Novel Features

**spz gene *Drosophila***

transcripts first intron  
misinterpreted as new exon

**spz gene *Drosophila***

transcripts first intron  
are from opposite strand  
is a new protein

Some applications:

1. Refine Transcriptomes
2. Focus on Non-Coding RNAs
